# ATTITUDES TOWARDS GENDER-INCLUSIVE SPANISH TWEETS\*

Katie Slemp York University

### 1. Introduction

Spanish, like other major Romance languages, has binary grammatical gender. This means that every noun and modifier, animate or not, is marked with either feminine or masculine gender. Animate nouns are marked for gender, and this generally corresponds to the perceived biological sex of the referent. Inanimate nouns like floor (*el piso*) and table (*la mesa*) are masculine and feminine, respectively. Generally, nouns that end in -o are masculine, and those that end in -a are feminine, although there are exceptions. This has become a source of discontent among Spanish speakers as social gender roles expand alongside gender identities outside of the traditional binary. Nonbinary, agender, and gender fluid individuals, for example, are unable to express themselves easily in Spanish due to the binary grammatical gender that is required. Furthermore, the Spanish language is dominated by masculine generics, often referred to as false generics, where mixed groups of individuals are referred to, often exclusively, in the masculine form. This has been criticized for its erasure of women, and more recently for its erasure of nonbinary individuals.

The criticism of the widespread use of masculine generics began predominantly in the 1980s. Due to feminist movements, many language academies published guidelines on how to incorporate gender-inclusive language that included both men and women in Spanish. At that time, the strategy was primarily to incorporate the use of doublets in the language. With the widespread use of the personal computer came a further innovation, the inclusive marker -@, which indicates both masculine and feminine gender simultaneously (with an a surrounded by an o), thus facilitating writing, although it is generally pronounced orally as a masculine generic. To express gender identity outside of the traditional male-female dichotomy, Spanish speakers have begun to innovate with their language, despite normative pushback. The first neutral innovation to appear in Spanish was in 2004, when the -x was incorporated. The -x has received criticism for not following phonological and syllable structure in Spanish, for being a borrowing from English, and, by language purists, for being an attempt to corrupt the Spanish language. The -x, as well as doublets and -@ are in use today.

The newest innovation to appear, in the mid 2010s, is the gender-neutral morpheme -e. The incorporation of this morpheme has increased dramatically. Phonologically, there is no debate as to its pronunciation. Furthermore, it mimics existing nouns and adjectives

<sup>\*</sup> Thank you to Dr. Michol Hoffman for her assistance in the creation of the survey instrument and to Dr. Ruth King for her feedback during the editing of this paper.

in Spanish (e.g., estudiante 'student'<sup>1</sup>, verde 'green') that are not overtly marked for gender. Because only doublets have been institutionally sanctioned to express gender-inclusivity (in the binary sense), it is important to examine how Spanish users themselves are incorporating inclusive language. One way to do this is by utilizing Twitter, a social media site where users post thoughts, questions, and opinions in less than 280 characters. Twitter is a useful resource because it is public and informal. Furthermore, there has been no research that has analyzed attitudes towards the use of gender-inclusive language in Spanish and whether these attitudes differ according to the person who is using innovations. Finally, we do not know if there are any relationships between the demographic characteristics of individuals and the attitudes they have towards inclusive language. For this reason, the research questions guiding this investigation are:

- 1) How are users on Twitter incorporating Spanish gender-inclusive language?
- 2) What are the language attitudes towards the use of gender-inclusive language on Twitter? Do these attitudes change depending on the perceived author of the tweet?
- 3) Are there any relationships between demographic variables and language attitudes towards gender-inclusive language?

### 2. Literature review

#### 2.1 Gender in Romance

All major modern Romance languages, apart from Romanian, have a binary grammatical gender system (Loporcaro 2018). The masculine form in Romance is the syntactically unmarked form and systematically occurs on agreement targets in default contexts. Noun morphology aids in gender agreement and is a reliable cue for establishing correct agreements in the phrase and sentence (Alarcón 2011). Native Spanish speakers use overt morphology as a strong linguistic cue for gender agreement in both comprehension and production (Alarcón 2011).

## 2.2 Gender-inclusive language in Spanish

Inclusive language generally only aims to modify animate nouns with human referents. Rather, inclusive language affects semantic gender rather than grammatical gender. Semantic gender is determined by the apparent biological sex of the referent and social gender roles. In Spanish, both grammatical and semantic gender are generally denoted by either an -o (masculine) or an -a (feminine). Spanish nouns with grammatical gender like floor (el piso) and table (la mesa) would not be altered by inclusive language, but nouns with semantic gender (e.g., chico and chica, 'boy' and 'girl'), would. There are different

\_

<sup>&</sup>lt;sup>1</sup> All translations and glosses are my translations.

types of inclusive language currently found in the Spanish language. In keeping with the growing feminist movement in Spain in the mid 1980s, concerns were raised as to the interpretation of generic words and expressions, and consequently, the first guidelines for non-sexist language in Spanish were published (Ministerio de Educación y Ciencia 1988). This document offers various solutions, mainly encouraging doublets or collective forms.

Doublets tend to be lengthy in writing, and therefore a new innovative marker appeared that was compact, yet unpronounceable, the -@, which denotes both masculine and feminine endings (-o and -a). For example, a student body could be referred to as l@s alumn@s ('the students' MASC/FEM.PL), which would normally be pronounced with a doublet los alumnos y las alumnas ('the students MASC.PL and the students FEM.PL'), but could also be pronounced as los alumnus ('the male/mixed students' MASC.PL) because the @ symbol does not have an easily defined sound. This supposed solution was designed to combat the prescriptively accepted masculine plural form which is traditionally viewed as generic (Real Academia Española 2018). In recent years, -@ and doublets have been criticized as not being inclusive of all genders, as they still indicate a binary male/female option (de Onís 2017). Guidelines for non-sexist language have appeared recently in Latin America (Ramírez Vélez 2009) and, in these guidelines, the author recommends avoiding using the -@ because it is not a "linguistic symbol" but recommends using doublets instead (Ramírez Vélez 2009:19). Due to criticism of the binary nature of the suffix -@ and of doublets, a new way to mark inclusivity appeared.

The grapheme -x has begun to be incorporated since the early 2000s as an ungendered suffix. It first appeared in 2004, in written discourse as a non-gendered alternative (Milian 2017). This option has been popularized by the term Latinx, referring to Latin American people of all genders. According to Milian (2017), the term Latinx has been traced to online forums in the 1990s, but the first major appearance of *latinx* was in the 2004 (Fall) volume of the journal Feministas Unidas (Padilla 2016). Some argue in favor of the -x because of its simplicity. For example, *latinx* is easier to type than *latin*@ and latina/o from a mobile device (DeGuzmán 2017). While the usage of this grapheme has been further and further incorporated into written discourse (one can easily find occurrences of todxs, lxs chicxs, etc.), the pronunciation of this -x has only recently undergone investigation (e.g., Milian 2017, Slemp et al. 2019, Slemp 2020); however, these studies do not exhibit uniform results on how the -x is pronounced. Vidal-Ortiz and Martínez state that *latinx*, if accepted, is an "explicit incorporation" (2018:394) of gender minorities in Spanish. The term *latinx* is used most frequently by students in college and universities (Salinas and Lozano 2017). Latinx began spreading beyond LGBTQ+ communities in 2015, out of a desire to get away from the masculine-centric latino and the binary gender-inclusive latin@ (Scharrón-Del Río and Aja 2020). The introduction of latinx was driven by millennials on social media, like Facebook and Instagram, and not in spaces related to the academy, apart from the initial appearance in 2004 (Vidal-Ortíz and Martínez 2018). It is not until 2016 that we see Latinx reappear frequently in conference and association presentations (Salinas and Lozano 2017). Latinx moves beyond latin@ to encompass genders outside of the limiting man-woman binary, despite the previous movement regarding -@ as inclusive (Guidotti-Hernandez 2017). Many researchers state that the use of *latinx* aims to neutralize the sex-gender binary inherent in the Spanish language (e.g., Arce 2015, Haddock-Lazala 2016). DeGuzmán (2017) writes that the use of the -x may not be the ultimate solution to gender inequality in the Spanish language, but rather a critique of gender centrality in gender-neutrality or fluidity.

The -x has been critiqued for being problematic in terms of pronunciation, and a new inclusive morpheme has appeared in response: -e. To clarify, the incorporation of the grapheme -e as a not overtly marked gender suffix to avoid the overt gender markings -o and -a is an innovation that mimics existing nouns and adjectives in Spanish (e.g., estudiante 'student', inteligente 'smart'). Nouns and adjectives that are normally overtly marked are modified by the incorporation of -e (amigo MASC.SG becomes amigue NEUT.SG, pequeño MASC.SG becomes pequeñe NEUT.SG). Vidal-Ortiz and Martínez (2018) affirm that the closest linguistic element to a gender-neutral suffix is the -e and it has been used for years by activists in Latin America. The authors also state that the -x is often pronounced as /e/ to avoid the consonant cluster /ks/ which is unpronounceable in Spanish as a syllable nucleus (Vidal-Ortiz and Martínez, 2018).

This is confirmed by Slemp et al. (2019), where the phrase *carrera para todxs* is pronounced as [to.ðos] but corrected to [to.ðes]. In the YouTube corpus compiled by Slemp et al. (2019), the researchers find that the countries where inclusive language occurs the most are Spain and Argentina. Additionally, the written -x forms appearing in the titles of the videos are primarily pronounced as doublets (either masculine-feminine order or secondarily as feminine-masculine order). For example, a video with the word *todxs* would begin with a spoken greeting to todos y todas, not \*[to.dk.ses] or [to.ðe.ki.ses]. The second most common way that written -x forms were pronounced was using /e/. Forms using -e in writing or /e/ in pronunciation began to appear in 2013 in the YouTube corpus used by Slemp et al. (2019). This corpus is the only one which provides a relative chronology of different inclusive language forms. Through a survey and interviews, Slemp (2020) finds that the most common way to express inclusivity in speech and writing is the inclusive marker -e. Additionally, the statistically significant variables in the study are birth country and gender identity. The most common reported birth countries of users of inclusive language are Argentina, Colombia, and Spain.

## 2.3 Language variation and change

Normally, changes in the written structure of a language follow changes in spoken language (Fought 2013); gender-inclusive innovations in this case are the opposite, where the -@ and -x markers have been introduced into written language without regard for normative pronunciation or whether they are possible to pronounce at all. Adolescents are frequently the sector of speakers that drive language variation and change (Kirkham and Moore 2013). They are between adulthood and childhood, which creates the perfect environment to "adapt, resignify and reconstrue language variation" (Kirkham and Moore 2013: 399) so it is not surprising that the main generation participating in the Latinx movement is the adolescent group and younger adults (e.g., Guidotti-Hernandez 2017, Slemp et al. 2019, Slemp 2020). Additionally, women are more likely to use innovative forms in language when prestige is not a consideration (Queen 2013). Ethnicity may also

contribute to the pronunciation of gender-inclusive language (Fought 2013), and though it is not the focus of this project, one cannot ignore the intersectional relationship that exists between gender and ethnicity (Eckert and McConnell-Ginet 2003).

Language purists steadfastly oppose the inclusion of nonstandard forms and say that it could result in the decreased prestige of the Spanish language (Milian 2017). In actuality, the ability of a language to change and adapt is a sign of plasticity and health because thriving languages undergo constant changes while remaining recognizable as the same linguistic system (Vidal-Ortiz and Martínez 2018). Prewitt-Freilino et al. (2012), Eckert and McConnell-Ginet (2003), and Ehrlich and King (1992) remind readers that linguistic modification must be accompanied by social and political adjustments to truly change existing asymmetries in gender. Sarlo and Kalinowski (2019) also state that social change needs to accompany the changes happening in Spanish to allow for inclusive language. Indeed, Ehrlich and King claim that language is not a "neutral vehicle" and because it also conveys social values, therefore the introduction of genderneutral or inclusive terms does not mean that language will be nonsexist (1992: 152).

## 2.4 Language attitudes

According to Fishbein and Ajzen (2011), people use gender-inclusive language when they (a) hold favorable attitudes toward the behavior, (b) perceive supportive norms, and (c) perceive ease in utilizing inclusive language. Sczesny et al. (2015) completed two studies with German native speakers where participants reported moderately positive attitudes towards the use of gender-inclusive language but only incorporated genderinclusive language forms in about four out of ten of the fill-in-the-blank responses. Additionally, gender-inclusive language was significantly predicted by frequency of past behavior and marginally by intentions. Sczensy et al. (2015) found that gender-inclusive language is a product of both deliberate and habitual factors. Spontaneous use of inclusive language was found to be guided by explicit intentions to use it as well as more implicit processes involving use of it in the past (Sczesny et al. 2015). One major factor that makes individuals use or reject gender-inclusive language is the novelty of genderfair forms, which conflicts with speakers' linguistic habits (Blaubergs 1980). Additionally, initiatives for gender-inclusive language were first instigated by activist movements and for that reason are often met with negative reactions (Sczesny et al. 2016).

In general, the reaction to gender-inclusive language depends on attitudes toward gender arrangements (Jost and Kay 2005, Carney et al. 2008). In Sczesny et al. (2015), sexist speakers avoid inclusive language because they are reluctant to change their linguistic habits and they also deliberately use a form of language that treats males as the norm and makes women less visible. According to Sczesny et al., "interpersonal communication contributes to gender stereotyping via written words, spoken utterances, and the mass media" (2015: 943). Research has linked gender-exclusive language with sexist beliefs and attitudes (Swim et al. 2004, Sczesny et al. 2015). This can go as far as those with sexist beliefs making deliberate decisions to use language that perpetuates gender stereotyping and supports patriarchy, as seen in Sczesny et al. (2015) where

participants deliberately avoided using gender-inclusive language because they viewed it as oppressive political correctness or felt that it was unnecessary due to the availability of (false) masculine generic.

Gender belief systems can lead to people adopting certain language forms. For example, Jacobson and Insko (1985) show that participants with stronger sexist attitudes choose non-sexist pronouns in English (e.g., they) less frequently than participants with less sexist attitudes. Men score higher on sexist attitudes, and men have been found to use more masculine generic pronouns than women (e.g., Rubin et al. 1994, Pauwels 2003, Cralley and Ruscher 2005). Gender-inclusive language use appeared to require explicit, intentional decision making in these studies. Studies have been done on why speakers choose to incorporate gender inclusivity into their speech, but not extensively in Spanish (e.g., Sczesny et al. 2015, Patterson 2017). Sexist attitudes are negatively related to language attitudes towards gender-inclusive language in English (Sarrasin et al. 2012). Masculine generics can also pose legal challenges for women and other gender minorities, unless it is specified that laws or legal documents apply to all people, or only men (Prewitt-Freilino et al. 2012). In a study by Stout and Dasgupta (2011), women experienced a lower sense of belonging, less motivation, and less expected identification than women exposed to gender-inclusive or gender-neutral language, meaning that inclusive language is important to include and motivate women. Gendered language contributes to gender biases by making gender salient to the speakers of that language (Bigler and Leaper 2015).

# 3. Methodology

## 3.1 Participants

The participants for this study are native or near-native Spanish users, over the age of 18, and have normal or corrected to normal vision.

### 3.2 Procedure

Using search terms for common inclusive words like todxs/todes/tod@s and amigxs/amigues/amig@s (from Slemp et al. 2019), a corpus was compiled of recent uses of common gender-inclusive terms in Spanish on Twitter. Due to the various ways to type doublet forms, doublets are not included in this study. The tweets were collected in November 2020. These markers are also being incorporated in Portuguese to indicate gender inclusivity, but only tweets in Spanish were considered in the present study. The tweets in the corpus were used to create artificial tweets from imaginary authors in four different categories: personal, business, political, and academic. Each category contains three different tweets that incorporate the three inclusive markers used in social media. These tweets were created using an online tweet generator<sup>1</sup>, so that they would appear

<sup>1</sup> https://zeoob.com/generate-twitter-tweet/

like screenshots of actual tweets and were utilized as part of a language attitudes survey that was created on Qualtrics. The date, time, and number of likes and retweets was kept consistent. Each tweet was accompanied by an acceptability score slider and two follow-up questions: 1. Why did you choose this score? and 2. What is the author of the tweet like? The acceptability score was mandatory to complete, but the follow-up questions were not. The responses were downloaded into an Excel spreadsheet where responses that did not complete at least one acceptability score were deleted (n=9). The remaining participants' data (n=20) were translated into English and input into jamovi (The jamovi project 2019) where statistical analysis was completed.

### 3.3 Stimuli

An example of the artificial tweets created for the present study is shown in Figure 1, below.

**Figure 1.** Hypothetical tweet from the author 'country president'. Translation: It does not matter the country you come from, it does not matter the city you live in, it does not matter if in your country this does not happen. You all must help distribute this information for all NEUT.PL of them NEUT.PL that do not know.

### 4. Results

The following section presents the data collected from the Twitter corpus and the language attitudes survey.

### 4.1 Qualitative results

Some of the participants rated the artificial tweets according to the grammatical structures and provided this as the reason for their score. On average 1-2 people per tweet provide a

grammatical error as the reason for choosing their specific acceptability score (e.g., falta una tilde 'it lacks an accent'; faltas de ortografía 'errors in orthography'). It is interesting that participants commented on grammatical errors on tweets, which are informal. However, some individuals did provide reasons related to their preferences or aversions to the inclusive marker appearing in the tweets. About the -x, many participants stated la x es dificil de pronunciar ('the x is difficult to pronounce'). Similarly, for the -@, many participants state it is difficult to pronounce and additionally @ solo podría indicar dos géneros ('@ only indicates two genders'). The -e marker seems to be the most positively reviewed, with phrases like buen uso del lenguaje inclusivo ('good use of inclusive language'). When ranking the uses of inclusive language, doublets are the most preferred option, and the -e is the next most preferred.

Finally, there was one participant (a man, 27-40 years old) who expressed extreme aversions to inclusive language that provided reasons such as:

- (1) parece escrito por alguien con retraso mental leve a moderado 'it seems written by someone with mild to moderate mental retardation'
- inaceptable por parte de una Universidad que se digne de serlo ceder ante la presión de la agenda política de la izquierda moderna. Una deshonra 'unacceptable for a university that deigns itself to be one, yielding to the pressure of the political agenda of the modern left. A disgrace'
- (3) el uso del morfema 'x'como supuesta marca inclusiva es ajeno a la morfología del español, además de innecesario, puesto que el masculino plural sirve para referirse a colectivos mixtos 'the use of the morpheme 'x' as a supposed inclusive marker is foreign to the morphology of Spanish, in addition unnecessary, because the masculine plural is used to refer to mixed collectives'

When asked why individuals incorporate inclusive language, nine out of ten participants stated something along the lines of visibility, respect, or inclusion. The participant **above** stated *porque son ignorantes de las características más elementales del idioma español* ('because they are ignorant of the elemental characteristics of the Spanish language').

### 4.2 **Quantitative results**

Table 1 (below) contains the breakdown of gender for the 20 participants.

**Table 1.** Frequencies of reported gender identity.

	Count	% of total
Woman	13	65%
Man	5	25%
Gender diverse	2	10%

Participants identifying as women comprise the majority of the sample, men only a quarter, and only two individuals (10%) selected a gender identity that was not man or woman. These two individuals had to be combined into one category, although they did not select the same gender identity, for statistical analysis. The other demographic variables were found to have no statistical significance and will therefore not be presented in the present article.

The Twitter data was collected on various days throughout November 2020, utilizing the same search terms each time and collecting the tweets starting at the top of the list. The most popular inclusive marker is -e, followed by -x. Forms with -e were more widespread in use on Twitter. The breakdown of the Twitter data mine is found below in Table 2.

**Table 2.** Inclusive markers on Twitter.

	Counts	% of total
-x	13	33%
-е	18	45%
<b>-</b> @	9	22%

Below, the group means for the type of inclusive marker and tweet category are presented. The newest inclusive marker, -e, has the highest average acceptability score, and the -x has the lowest.

**Table 3.** Average acceptability score for each inclusive marker.

	Average acceptability score	
-x	3.42	
<b>-</b> е	3.62	
<b>-</b> @	3.49	

The tweet category with the highest average is the academic tweets. The lowest means are from the personal and business categories (see Table 4, below).

**Table 4.** Average acceptability score for each tweet category.

	Average acceptability score
Academic	3.87
Personal	3.33
Business	3.33
Political	3.51

There is no significant difference between the group means of the type of inclusive marker or tweet category via One-Way ANOVA. After completing statistical analysis, the only demographic variable found to have statistical significance on the data via a One-Way ANOVA was gender identity. The mean, standard deviation, and standard error for each gender identity can be found below in Table 5.

**Table 5.** Descriptives according to gender identity (collapsed).

	Gender	N	Mean	SD	SE
Political	Diverse	2	2.83	0.236	0.167
	Man	5	2.60	2.278	1.019
	Woman	11	4.20	0.748	0.226
Personal	Diverse	2	4.17	0.236	0.167
	Man	5	2.07	1.673	0.748
	Woman	9	4.07	1.103	0.368
Academic	Diverse	2	4.67	0.471	0.333
	Man	3	3.11	2.411	1.392
	Woman	8	3.96	0.744	0.263
Business	Diverse	2	4.17	0.707	0.500
	Man	5	2.07	1.770	0.792
	Woman	9	3.78	1.067	0.356
-x	Diverse	2	3.63	0.177	0.125
	Man	4	2.25	2.072	1.036
	Woman	12	3.65	1.184	0.342
-@	Diverse	2	3.88	1.237	0.875
	Man	5	2.15	1.867	0.835
	Woman	8	4.07	1.268	0.448
-е	Diverse	2	3.63	0.884	0.625
	Man	5	2.15	2.118	0.947
	Woman	9	4.28	0.678	0.226

Table 5 (above) displays the group averages for each tweet category and inclusive marker. Women rated the political tweets more highly than the gender diverse individuals and the men, who had the lowest group mean. The men also had the highest standard deviation, showing there is a lot of variation in the group. In general, the participants that

identified as women rated the tweets positively and consistently as there was never a group mean of less than 2.5. In contrast, the group mean for the participants that identified as men can be seen to be negative in multiple categories above. The two individuals who identified outside of the man-woman binary frequently rated the tweets similarly to the women, although there are a few exceptions; namely, the significant result of the political average. The category found to have a significant relationship with gender identity is political average, shown below in Table 6.

**Table 6.** One-Way ANOVA (Welch's) for gender identity.

	F	df1	df2	p value
Political	10.919	2	6.40	0.009
Personal	3.442	2	7.42	0.088
Academic	1.396	2	2.99	0.373
Business	1.775	2	3.75	0.287
-x	0.793	2	6.46	0.492
<b>-</b> @	1.713	2	3.05	0.317
-e	2.164	2	2.61	0.279

The only category that has a p-value less than 0.05 is the political average according to gender, although the personal average according to gender has a p value that is near significant (less than 0.10). For the personal tweets, the gender diverse individuals and women have means that are high in value and similar in value. The men, however, have the lowest mean and the highest standard deviation again.

## 5. Discussion

On Twitter, the most popular inclusive marker is -e. However, inclusive markers are not fully incorporated by users. This can be shown in some tweets where an inclusive marker is used in a common term but not extended to the full morphosyntax and the masculine generic may also appear (por qué andan todxs tan neuróticos 'why are you all NEUT.PL going around so neurotic MASC.PL' tweet from @jorcas00). Additionally, some users use multiple inclusive markers in the same tweet (Amigues, estoy en búsqueda de un depto de 2 ambientes para mí y mis 3 hijxs 'friends NEUT.PL I am looking for an apartment with 2 rooms for me and my three children NEUT.PL' tweet from @meli\_nita\_). A question for further investigation is: are the -x and the -e (as both gender neutral markers) equivalent? Above, the -x and the -e are used in the same tweet, but in different words. Does the author view those as the same type of inclusivity? Overall, participants rated each type of inclusive marker positively (above a midpoint of 2.5), with the -e having the highest average acceptability score. By measure of a One-Way ANOVA, there was no significant difference between the group means for the type of inclusive marker. It is not surprising that the -e has the highest rating for acceptability due

to its popularity and feasibility of use as seen in the previous literature (Slemp et al. 2019, Slemp 2020). It is surprising that the participants ranked -@ the highest, but -e received the highest average acceptability score. This could possibly be the result of the longstanding acceptance of -@ compared to the novelty of -e, but further research is needed.

Similarly, all the tweet categories were also rated positively (above 2.5 average), with the academic tweets having the highest group mean. However, again with the One-Way ANOVA, there is no significant difference between the group means for tweet category. The only statistically significant relationship found was between gender identity (collapsed) and the political average. Women had an extremely high average for the political tweets (over 4) whereas men had the lowest average for these tweets (only slightly positive at 2.60) and they also had the highest standard deviation. This confirms what the literature review states about women using non-standard forms when prestige is not a factor (Queen 2013).

Twitter is an informal environment, so it could be argued that prestige is not considered a factor. However, participants frequently pointed out grammatical errors in the tweets in this study, meaning standard or prestige language matters somewhat to participants. Additionally, the literature shows that women are more supportive of inclusive language (Sczesny et al. 2015). This is confirmed in this study, as gender identity is the only significant variable found in the analysis. Many participants reported pronunciation difficulties for the -x and -@ inclusive markers. Regarding -@, many participants also stated that it is problematic because it is binary and only refers to men and women, excluding other gender identities that exist in the world (las y los es que llevaba varios siglos usándose, pero las personas poco a poco vamos entendiendo que existe un grupo que no se identifica con ninguno de las dos. El de las les es más intuitivo para pronunciar 'las FEM.PL and los MASC.PL is what has been used for centuries, but people have been, little by little, understanding that a group exists that does not identify with either of the two. The les NEUT.PL is more intuitive to pronounce').

There was one participant who consistently opposed the inclusion of inclusive language and stated that the masculine pronoun is sufficient to mixed collectives. This individual (man, 27-40 years old) used offensive judgements about inclusive language targeting the hypothetical author's intelligence or their supposed political affiliation (18-24 años, Argentina, mujer heterosexual, estudiante universitaria, marxista feminista '18-24 years old, Argentina, heterosexual woman, university student, Marxist feminist'). While this participant provided responses that are sexist and in line with previous research for those opposed to inclusive language (e.g., Sczesny et al. 2015, Sczesny et al. 2016), he did also frequently state that he believed the hypothetical tweet was written by someone from Argentina. This also supports previous research that inclusive language is commonly tied to Argentina (Slemp et al. 2019, Slemp 2020).

Overall, language attitudes towards inclusive language are positive in relation to hypothetical tweets for each of the inclusive markers and the tweet categories tested in this study. However, the sample in this study is small and language attitudes toward gender-inclusive language warrant more investigation. For example, Twitter is a relatively informal space for communication, so language attitudes might be more

positive towards tweets than towards textbooks or official documents and guidelines. Nevertheless, gender-inclusive language is growing in popularity. Each of these inclusive markers is present on social media, and every participant in the survey recognized the markers as inclusive, whether they felt inclusive language was necessary or not.
